

Electrosmog as a Causer of Disease

Electrosmog is the causer of severe diseases. For this reason the legislator has set threshold limits. Common causes of health problems are high voltage transmission lines, transformers, radar and mobile phone transmitter installations.

The cause often lie in the home itself: Grounding problems, uninsulated power lines, electrically conductive materials and installation faults, strong field electrical devices, electrical blankets, water beds, beds and armchairs with electrically controlled height, etc. and electrical radio clocks that are located too close to the bed.

Electrical alternating fields from power cables in walls or from bedside lamps can jump to metal coils e.g. the springs in a mattress, and induce fields of over 100 volt meter, that one cannot necessarily feel but the vegetative nervous system must battle with it every night. The high fields lead to body voltages of several thousand millivolts. The normal value of body cells is 90 millivolts! It is understandable that one should feel knocked out or not refreshed upon waking.

The use of mobile phones has a catastrophic impact on brain waves, nervous system, blood structure, and hormonal system. Wireless DECT telephones in the home cause a continuous radiation with microwaves from the base station. Wireless computer connections, like a wireless LAN irradiate the entire home. Children are especially at risk, as they absorb more radiation per body weight than adults. Typical symptoms are hyperactivity and ADS. Furthermore, the vegetative nervous system of growing children is not yet fully developed, whereby excessive electrosmog has an effect on the full and healthy development.

Electrosmog can be quickly measured and often eliminated without excessive cost. One should be especially skeptical when concerns regarding the health risks are answered with reference to the adherence to threshold values, as practical experience has shown that these lie up to a factor of 1000 too high for biological compatibility.

If you ever check the names of the committee who set the threshold values, you will quickly find names that are at home in the management boards of mobile network providers. People think that the government is independent of business and that limits are set based upon studies that test a-thermal effects. Unfortunately we must declare that this is not the case and that the industry sets its own limiting values.

In this context, it is interesting to see that across Europe every country determines its own levels. Germany is by far the country with the highest limits in Europe. Are other Europeans less robust than German people?

Electrosmog as a Causer of Disease

General Feeling of Lethargy General Weak Condition "Burn Out - Syndrome" collected from Case Studies and Literature Electrosmog Beschwerden u.a. nach Dr. Dr. Ing. A. Varga (Electrosmog Disorders among other things by Dr. A. Varga, Dr. Eng)	
Sleep disturbances Fatigue Hormonal disturbances Menstruation disturbances Immune depression Metabolic disturbances	Headaches Pains in limbs Stomach ache Nausea Swelling, Lymph nodes, Eyelids Tooth problems
High blood pressure Circulatory disturbances Blood circulation disturbance Blood clotting Heart rhythm disturbances Heart attack Agitation Ear noises, Tinnitus Thrombosis Stroke	Allergies Hay fever Skin rash Recurring infections Inflammation Sight disturbances Eye irritation
Depression Nervousness Irritable Lack of concentration Slow reaction time ADS syndrome in children Learning difficulties Memory lapse Neuralgic difficulties Migraines Alzheimer Epilepsy	Accelerated cell growth Cancer promotion Change in blood count Rouleau formation of blood cells, prevents sufficient oxygen supply to the body Leukemia Breast cancer Brain tumor Eye cancer Misc. tumor diseases
	Fertility disturbances Virility disturbances Childlessness Miscarriage Sudden infant death

People cannot smell, taste, see, hear nor feel electrosmog, but it damages the body. Therefore, they are well advised to have a measurement taken in the workplace as well as in the home, in order to identify the invisible danger, and to eliminate it as far as possible, so as to protect oneself. It is especially essential at nighttime during the regeneration phase of the body to have a disturbance free sleep to enable a recuperative sleep. During the night while sleeping, when the body cannot defend itself, it reacts more sensitively to influences than during the day. One indication would be for example, if a child changes its sleep position so that only one third of the bed is used, that means that the body is unconsciously fleeing from geopathological influences and/or electrosmog.

If western medicine continues to work only on the basis of symptom treatment without once looking behind the scenes to find the real causes, and the business may set their own limits for the health damaging electrosmog, as an ordinary person it is worth keeping a critical eye on the body's signals.

When it was decided to enable mobile telephony in Germany, it was decided in the best knowledge and conscience that when the body temperature increased by one degree, that this radiation level was the highest allowable. Today we know that the biological effects occur far below the legal limits. **Therefore, it is aimed for that within the framework of the European directives a biologically allowable radiation limit be found.**
