

Protect your Health from Electromog and Earth Radiation

How do geopathological and technical interference fields cause health disorders?

- Scientists proved in studies that the epiphysis, the pineal gland in the brain, is so disturbed by electromagnetic fields and earth radiation, that it can not produce anymore the most important hormone for controlling our immune system: MELATONIN
- This results in a collapse of the immune system. As a result, killer cells acting against pathogenic germs are not produced in sufficient amounts; the person loses the body's defences and its natural protection against cancer. The person is also vulnerable to all types of diseases. Due to the melatonin deficiency, the cells are no longer protected against so called free radicals, aggressive oxygen molecules with cell damaging effects.
- The disturbance free place of sleep has therefore a significant relevance, as ninety percent of the essential melatonin is produced during the night. Freiherr von Pohl, translated Baron von Pohl, proved the interrelation between earth radiation, in this case subterranean water courses, and cancer as the worst-case complication in 1929.
- Areas of disturbance are precursors to chronic existential disorders and serious illnesses. Many years of experience demonstrate that as long as the person is exposed to the disturbance field, all treatments will be unsuccessful or only work in the short term, due to the continued resistance to therapy. Healing is only possible when the causes have been removed.
- In addition, chemicals that are used in many conventional medicine medications act as melatonin inhibitors and block the immune system. These are normally prescribed in doctor's practices for the treatment of the symptoms of disturbance fields. These types of medications are not used in naturopathy.

TEST

Test Yourself!

Cross the appropriate criteria if they frequently or regularly occur.

1)	Lethargy, fatigue or tiredness in the morning, often lasting for the whole day	<input type="radio"/>
2)	Feeling cold or sweating in bed, grinding and chattering of teeth, night sweat	<input type="radio"/>
3)	Morning pain symptoms, that abate during the day, e.g. morning migraine, limb aches	<input type="radio"/>
4)	Unsettled sleep, bad dreams – nightmares, crying out while sleeping, crumpled bed sheets, repeated nightly visits to the toilet	<input type="radio"/>
5)	Several hours of not being able to sleep, resistance to go to bed	<input type="radio"/>
6)	Lying across the bed, with legs drawn in, constantly rolling to one side of the bed, evading in bed, rolling out of the bed	<input type="radio"/>
7)	Leaving the bed, for children between midnight and 2 a.m., not being able to stay in bed, "night-walking", crouching and rocking in bed, crying for no apparent reason	<input type="radio"/>
8)	Depression, ill-humor, nervousness, discomfort, unease, crying upon waking	<input type="radio"/>
9)	Cramps, palpitations in bed, high blood pressure and heart rhythm disturbances, especially in bed	<input type="radio"/>
10)	Continuous recurring or chronic illnesses, e.g. Tinnitus	<input type="radio"/>
11)	Loss of appetite, even frequent vomiting in the morning	<input type="radio"/>
12)	When traveling or at other locations one can sleep better, recurrence of the symptoms upon returning to your home	<input type="radio"/>
13)	When working at a fixed place: concentration problems	<input type="radio"/>
14)	States of exhaustion, breaking out in a sweat, feeling cold, tension, cramps	<input type="radio"/>

Analysis:

These criteria are evidence of influence of disturbance fields at the place of sleep. One of these criteria suffices as evidence, however generally several are present. If you crossed one or more of the criteria, you should have your place of sleep examined, as there is the danger with time, of severe health problems. In a few cases of exception, despite of the disturbance zone, people do not suffer from sleep disorders but still confirm criteria 1 of the test. However, health problems can occur without any warning symptoms.
