

Health Counselor Dr. Hager investigated Cancer Cases in Stettin

Extract from the book "Erdstrahlen", translation: Earth radiation, by Andreas Kopschina. In a research period of twenty-one years from 1910 to 1931, 1575 houses were identified where one death from cancer occurred, whereas in the same period there were houses where 38 deaths occurred. In those houses, one person died every 1.8 years from a statistical perspective! The cancer rate in those houses was therefore 3800 percent higher.

A medical study from 1992 confirmed again that the place of sleep is a risk factor for disease.

Conclusion: Cancer and location are interrelated

Every cancer patient should have a place of sleep examination. The cancer patient has to prevent to continue to sleep at an unprotected place! Houses with cancer illnesses are not uninhabitable, those houses, specifically the place of sleep, are only missing protection measures.

Radiation over Underground Water Courses

Why does an increased ionic density occur over underground water courses?

Ions are positively or negatively electrically charged atoms. Acids, bases and salts dissociate into ions when dissolved in water!!!

Source: Neues medizinisches Wörterbuch – translation: New medical dictionary 2.132, ISBN N 3-8166-9641-4

The underground water flow releases these materials from the ground. As a result, ions develop that penetrate to the earth surface and higher still beyond that. In this way, buildings are penetrated unhindered.
